

## ABSTRACT

An apparatus for a portable planer 12 having rails 14 with means for mounting to a single use stand 16, 18. The planer 12 has a pair of rails 14 with bolts 48 depending from the base thereof having threads with nuts 50 positioned on the distal ends whereby a stand 16, 18 having been constructed on site and leveled regardless of ground slope has means for receiving the threaded bolts 48 whereupon fasteners may be placed on the rail post distal ends whereby the rails form an integral part of the single use stand. The motorized planer 12 is mounted to a carriage 40 having wheels 42 for mounting on the rails 14 whereby the planer can be selectively moved from one rail end to the other. Positioned between the single use rail mounts are supports 26 for placing the work piece thereon for processing with the planer having means for receiving various blades 56, 58 and means for varying 62, 64 the height of the blade relative to the work piece.
